

Bridgewater to Somerset Refurbishment Project

Soil Boring Notification

Bridgewater to Somerset

Soil Boring Vegetation & Maintenance

March 2021

Hello from National Grid! As one of the regional electricity providers, we regularly update our systems to ensure you receive the best possible service to your homes and businesses every day. This letter is to notify you of some work in your area to improve the Bridgewater to Somerset transmission line.

National Grid has contracted with CDM Smith to perform geotechnical subsurface investigations such as soil borings to obtain information necessary to advance the project. The work will be conducted within National Grid's right-of-way that passes through your neighborhood.

Soil Boring is expected to occur mid-April 2021 through of September 2021. Over approximately 5 months CDM Smith's drilling crews will be taking soil samples along the Project route to help determine existing soil conditions. You may see machinery, similar to those pictured at right, within or near the existing structures in the right-of-way.

Part of the upcoming construction activity will be vegetation management activities, which is slated to begin in April and as we obtain permits. You will see crews traveling through the ROW mowing brush, trimming trees, to access the sampling locations. All personnel conducting the field investigations will carry proper photo identification and letters of introduction, which will be made available upon request.

You have received this notification because you either own property or neighbour the National Grid property where this work will take place. If you have questions or concerns about this project, please contact Gary St. Fleur, Stakeholder Specialist at 508-243-8125 or email gary.stfleur@nationalgrid.com
